## Contents

We summarize some important properties of Pauli Matrices.

1. The three Pauli matrices are given by

$$\sigma_1 = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \quad \sigma_2 = \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix} \quad \sigma_3 = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} \quad (1)$$

2. The Pauli matrices satisfy the commutation relations.

$$[\sigma_i, \sigma_j] = 2i\epsilon_{ijk}\sigma_k \quad (2)$$

3. The square of each Pauli matrix is unity. So is the square of  $\hat{n} \cdot \vec{\sigma}$  where  $\hat{n}$  is a unit vector.

$$\sigma_1^2 = \sigma_2^2 = \sigma_3^2 = \hat{I}; \quad \hat{n} \cdot \vec{\sigma}^2 = \hat{I} \quad (3)$$

4. Every Pauli matrix anticommutes with the other two Pauli matrices. There does not exist a nonzero  $2 \times 2$  matrix which *anticommutes* with *all the three Pauli matrices*.

5. The above relations can be written in various different forms.

$$[\sigma_i, \sigma_j] = 2i\epsilon_{ijk}\sigma_k \quad (4)$$

$$\sigma_j\sigma_k + \sigma_k\sigma_j = 2\delta_{jk} \quad (5)$$

6. The above two relations imply that

$$\sigma_j\sigma_k = \delta_{jk} + i\epsilon_{jkl}\sigma_l \quad (6)$$

7. The above statements are can be rewritten as

- (a)  $[\vec{a} \cdot \vec{\sigma}, \vec{b} \cdot \vec{\sigma}] = 2i(\vec{a} \times \vec{b}) \cdot \vec{\sigma}$
- (b)  $(\vec{a} \cdot \vec{\sigma})^2 = |\vec{a}|^2$
- (c)  $(\vec{a} \cdot \vec{\sigma})(\vec{b} \cdot \vec{\sigma}) + (\vec{b} \cdot \vec{\sigma})(\vec{a} \cdot \vec{\sigma}) = 2(\vec{a} \cdot \vec{b})\hat{I}$
- (d)  $(\vec{a} \cdot \vec{\sigma})(\vec{b} \cdot \vec{\sigma}) = (\vec{a} \cdot \vec{b})\hat{I} + i(\vec{a} \times \vec{b}) \cdot \vec{\sigma}$

where  $\vec{a}, \vec{b}$  are two arbitrary numerical vectors.

8. The trace of each of the three matrices is zero. If we use the notation  $\sigma_0 = \hat{I}$  we have the relation, we can write

$$Tr(\sigma_\mu \sigma_\nu) = 2\delta_{\mu\nu} \quad (7)$$

9. The above identity can be used to prove linear independence of Pauli matrices. The four matrices  $\sigma_\mu, \mu = 0, \dots, 3$  form a basis in the complex vector space of all  $2 \times 2$  matrices.

10. Let  $S$  be complex  $2 \times 2$  matrix which is expanded in terms of the matrices  $\sigma_\mu$

$$S = \sum_{\mu=0}^3 C_\mu \sigma_\mu \quad (8)$$

The expansion coefficients are given by

$$C_\mu = \frac{1}{2} Tr(S \sigma_\mu) \quad (9)$$

11. The completeness relation for the Pauli matrices is contained in the identity

$$\sum_a (\sigma^a)_{ij} (\sigma^a)_{kl} = 2\delta_{il}\delta_{jk} - \delta_{ij}\delta_{kl}. \quad (10)$$

12. An important identity satisfied by the Pauli matrices is

$$\exp(i\vec{\alpha} \cdot \vec{\sigma}) = \cos |\vec{\alpha}| + i\vec{\alpha} \cdot \vec{\sigma} \sin |\vec{\alpha}| \quad (11)$$

where  $\vec{\alpha}$  is a vector and

$$(\alpha_1, \alpha_2, \alpha_3), \quad |\vec{\alpha}| = \sqrt{\alpha_1^2 + \alpha_2^2 + \alpha_3^2} \quad (12)$$
